Declaration

This work has not been previously submitted for a degree or diploma in any university. To the best of my knowledge and belief, this thesis contains no material previously published or written by another person except where due reference is made in the thesis itself.

Ibrahim A. Alghamdi

September 17, 2014

Acknowledgments

I would first like to thank God for giving me the strength and persistence to pursue my thesis, and for helping me throughout the entire process especially during the numerous times when I was short of ideas, and then suddenly the flow of ideas came.

I wish to express my special appreciation to Dr Robert Goodwin for being such a supportive supervisor. My deep appreciation is extended to Dr Giselle Rampersad, for being such as an amazing co-supervisor. Without their inspiration, generous support and encouragement, this work would never have come to fruition. From the first day they have provided me with invaluable knowledge and suggestions, and I have been very fortunate to have them as my supervisors.

Many thanks are due to the staff members in the Flinders University School of Computer Science, Engineering and Mathematics for their kind help and administrative support. I also wish to thank my PhD colleagues for giving me a memorable and enjoyable experience. I am also grateful to Flinders University for providing a good learning environment and research support.

Special appreciation is extended to the top management interviewees for their support during the data collection phase. I also appreciate the generous help of respondents who participated in my quantitative survey.

My deep gratitude and appreciation go out to my father, my brothers and my wonderful sisters. Their support and constant encouragement gave me the strength and determination that helped me during my PhD journey. My gratitude also goes out to my lovely family for their generous and warmest support. My beloved wife and best friend, Malak, who always listened and helped whenever she could. My sons Khalid, Abdulrahman, Abdullah and Abdulmalik were always proud of me, and were certain that I would be able to complete this thesis.

Finally, this study is dedicated to my father for his efforts and love.

Abstract

Information and Communication Technology (ICT) has become increasingly important in the development of nations. E-Government refers to the strategic use of ICT to transform the public sector. E-Government is regarded as a driver of citizen-centric, supportive, and advanced governance involving a transformation in how government re-engineers its internal processes and interacts with its stakeholders. Yet barriers can be encountered in the transformation to e-Government services due to limited readiness of a country's ICT infrastructure and deployment.

A review of the literature showed a lack of research in developing countries such as Saudi Arabia regarding e-Government, particularly pertaining to internal organisation factors. The majority of e-Government assessment models focus on the websites that offer service to the citizens. In addition, most existing models assess OEGR on a macro level (of the whole country) without performing an in-depth assessment at the micro level of public organisations. Consequently, an effective Organisational e-Government Readiness (OEGR) assessment model is essential for advancing appropriate e-Government implementation and transformation.

Given the significant investment in e-Government programmes and the need to allow such programmes to germinate, this study assessed OEGR in Saudi Arabia. Academic research on the main internal organisational factors leading to e-Government readiness is still sparse. Few organisational e-Government studies incorporate pertinent value dimensions.

To address this gap in the literature, an organisational e-Readiness assessment model was developed and described in detail in this study. This OEGR model can be used by a range of stakeholders including information technology managers and policy makers in improving OEGR within the public sector and thus in improving the quality of public service delivery.

A model was developed comprising the effect of seven main constructs: strategy, user access, the national e-Government programme (Yesser), portal, processes, ICT infrastructure and human resources on OEGR. The model factors, relationships, and hypotheses stemmed from the literature on Information Systems (IS), Electronic Commerce (e-Commerce), Electronic Readiness (e-Readiness), and e-Government

readiness. To test the model, the research focused on examining the relationships and interactions among these factors in an organisational e-Government environment using a study comprising organisations associated with the government of Saudi Arabia. A qualitative method was employed for interviewing leading e-Government officials in Saudi Arabia. Quantitative data was also collected through a questionnaire distributed to a sample of top management ICT and e Government specialists in Saudi Arabia. Data obtained from the survey was triangulated with data gathered from interviews.

The qualitative findings confirmed the significance of each construct in influencing OEGR, and revealed certain issues specific for the Saudi Arabian implementation context. Quantitative findings revealed that strategy, Yesser, portal, processes, ICT infrastructure, and human resources had a positive impact on OEGR, while there was no direct link found between user access and OEGR.

The model provided in this study is a systematic approach to assess the OEGR of public organisations and to guide them in self-assessments. The thesis contributes to the literature pertaining to assessments of information systems and e-Commerce in general and e-Readiness and e-Government readiness in particular. Furthermore, it offers a valuable tool to government organisations for assessing their e-Government readiness and in assessing the success of e-Government transformation efforts.
