

# **Silica Immobilised Metal Ion Activated Molecular Receptors**

A Thesis Presented for the Degree of

*Doctor of Philosophy*

by

Jozef Andrew Zbigniew Hodyl BSc.(Hons.)

at

Flinders University

School of Chemistry, Physics and Earth Sciences

Faculty of Science and Engineering

August, 2008

## TABLE OF CONTENTS

Abstract	ii
Declaration	iv
Acknowledgements	v
Abbreviations	vi
<b>Chapter 1</b> Introduction	1
<b>Chapter 2</b> Synthesis of macrocyclic receptor precursors	35
<b>Chapter 3</b> Guest molecule inclusion studies with the receptor model	52
<b>Chapter 4</b> Modification of the silica surface	70
<b>Chapter 5</b> Metal ion uptake studies with silica immobilised receptor ligands	87
<b>Chapter 6</b> Guest molecule inclusion studies with silica immobilised receptors	94
<b>Chapter 7</b> Experimental	121
<b>Appendices</b>	
Appendix A Binding constant determination procedure	154
Appendix B Determination of stoichiometry by the method of continuous variations	157
Appendix C Solid state $^{13}\text{C}$ CPMAS NMR spectra of some silica immobilised host-guest complexes	160
<b>References</b>	164

## ABSTRACT

Immobilisation of functional entities, such as, enzymes, onto solid supports, as a means of facilitating their removal from the surrounding environment and subsequent regeneration has been in practice for many decades. This work focuses on the immobilisation and analysis of three-walled (pendant armed), cyclen based receptor complexes immobilised onto a silica surface for the purpose of sequestering aromatic anions from aqueous solution: Si-GPS-[Cd(Trac)](ClO<sub>4</sub>)<sub>2</sub>, Si-GPS-[Cd(DiPTrac)](ClO<sub>4</sub>)<sub>2</sub>, and Si-GPS-[Cd(TriPTrac)](ClO<sub>4</sub>)<sub>2</sub> were the immobilised receptors used.

Initially, synthesis of a three-walled model receptor, [Cd(TracHP12)](ClO<sub>4</sub>)<sub>2</sub>, that is not bound to silica yet mimics the properties of the silica anchored receptor complexes with a hydroxypropyl pendant arm was effected. Aromatic anion binding constant measurements were made on the model receptor using <sup>1</sup>H NMR monitored titrations in DMSO-d<sub>6</sub> which showed that, in comparison to the first generation four-walled receptors, the removal of one of the pendant arms did not affect the binding capability of the receptor's cavity significantly. It was shown that the binding strength correlated well with the pK<sub>a</sub> of the particular anion with, for example, *p*-hydroxybenzoate > *m*-hydroxybenzoate > *o*-hydroxybenzoate. The precursor to this receptor was then immobilised onto a silica surface and subjected to metal ion uptake studies to gauge its coordination properties with a number of divalent metal(II) ions: Cd(II), Pb(II), Zn(II), Cu(II) and Ca(II). The three Cd(II) coordinated receptor complexes mentioned above were then subjected to inclusion studies with a number of aromatic anions in aqueous conditions whereupon a reversal of the previously mentioned trend, *i.e.* *o*-hydroxybenzoate > *m*-hydroxybenzoate > *p*-hydroxybenzoate was observed. This indicated that the presence of water in the system changes the

hydrogen bonding mode of the host-guest complexes, and was a major discovery arising from this work.

## DECLARATION

I certify that this thesis does not incorporate, without acknowledgement, any material previously submitted for any degree or diploma in any university; and that to the best of my knowledge and belief it does not contain any material previously published or written by another person except where due reference is made in the text.

## ACKNOWLEDGEMENTS

I would like to begin by thanking my supervisor Prof. Kevin P. Wainwright, firstly, for allowing me to conduct these studies and, secondly, for his undivided assistance, support and enduring patience. Many thanks also to Dr. Martin Johnston for his help and wealth of expertise with regard to NMR spectroscopy. I would also like to thank Dr. Ron Smernik of the Waite Institute for acquiring the initial solid state NMR spectra for me and for his advice when I acquired the spectra myself.

I would also like to express my gratitude to the many souls who have at one time or another resided in room 337: Dr. Adam Bradbury, Dr. Akhmad Damsyik, Professor Xu Xing You, Dr. Yakub Baran, Tim Robinson, La Ode Kadidae, Saprizal Hadisaputra, Lachlan Cavell, Blake Tooth, Rachel King, Kim Salvatore, Zihan Poh and Thomas Carter. Also I would like to thank the countless individuals catacombed throughout Physical Sciences for their entertaining and informative discussions.

In finality, but definitely not with the least of my thanks I am eternally grateful to my "long suffering" wife Debbie who has had to endure my many absences and without whose encouragement and love, survival of the "long haul" of these PhD studies would have been tough.

## ABBREVIATIONS

Å	Ångstrom ( $10^{-10}$ m)
APT	attached proton test
b	broad
c	$\text{g ml}^{-1}$
cbz	carboxybenzyl
CD	cyclodextrin
CP	cross polarisation
CTAB	cetyltrimethylammonium bromide
cyclam	1,4,8,11-tetraazacyclotetradecane
cyclen	1,4,7,10-tetraazacyclododecane
$\delta$	chemical shift
DiPTrac	1,4,7- <i>tris</i> ( <i>S</i> )-2-hydroxy-3-[4-((2-(2-hydroxyethoxy)ethoxy)phenoxypropyl)]-1,4,7,10-tetraazacyclododecane
DMF	dimethylformamide
DMSO	dimethylsulfoxide
DNA	deoxyribonucleic acid
DOTA	1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid
DOTAM	1,4,7,10-tetrakis(acetamido)cyclen
DOTEP	1,4,7,10-tetraazacyclododecane-1,4,7,10-tetrakis(methyleneethylphosphinate)
DRIFT	Diffuse Reflectance Infrared Fourier Transform spectroscopy
EC	encapped

EtOH	ethanol
GPDMMS	glycidoxypropyldimethylsilane
GPDMES	3-(glycidoxypropyl)dimethylethoxysilane
GPS	glycidoxypropylsilane
GPTS	3-(glycidoxypropyl)trimethoxysilane
{ <sup>1</sup> H}	proton decoupled
HTPE	hydroxy terminated polyether
<i>J</i>	coupling constant
<i>K</i>	apparent stability constant
K	Kelvin
kHz	kilohertz (10 <sup>3</sup> s <sup>-1</sup> )
kJ	kilo Joule
m	multiplet
M <sup>2+</sup>	unspecified divalent metal ion
MAS	magic angle spinning
MCM-41	Mobil catalytic or crystalline material - batch 41
MeCN	acetonitrile
MeOH	methanol
MHz	megahertz (10 <sup>6</sup> s <sup>-1</sup> )
NMR	nuclear magnetic resonance
OTs	tosylate
PEG	polyethylene glycol
p <i>K</i> <sub>a</sub>	-log <sub>10</sub> <i>K</i> <sub>a</sub>
pm	picometre
ppm	parts per million
r	radius
s	singlet

SBP	sulfate binding protein
t	triplet
<i>tert</i>	tertiary
tlc	thin layer chromatography
TMCS	trimethylchlorosilane
TOSS	TOtal Suppression of Spinning Side-bands
Trac	1,4,7- <i>tris</i> -(( <i>S</i> )-2-hydroxy-3-phenoxypropyl)-1,4,7,10-tetraazacyclododecane
TracHP12	1-(2-hydroxypropyl)-4,7,10- <i>tris</i> -(( <i>S</i> )-2-hydroxy-3-phenoxypropyl)-1,4,7,10-tetraazacyclododecane
TriPTrac	1,4,7- <i>tris</i> ( <i>S</i> )-2-hydroxy-3-[4-(2-(2-(2-hydroxyethoxy)ethoxy)-ethoxy)phenoxypropyl]-1,4,7,10-tetraazacyclododecane
UV-vis	ultraviolet-visible spectroscopy
VOC	volatile organic compound
